

INSTRUMENTATION SMOKE — NOT PAPER RESULT

Run: smoke_instrumentation_clean_20260910_run_001 | operator event window: 5.358 s | UTC: 2026-09-10T08:35:38.311821+00:00 to 2026-09-10T08:35:43.669651+00:00

Included samples: resource rows n=160, perception frames n=91, planner publications n=10, topic-health full intervals n=4 (32 rows)

Jetson whole-recorder telemetry (n=17; not event-filtered): GR3D load mean/max 0.0/0.0%; instantaneous rail mean/max: VDD_CPU_CV 8.19/10.61 W, VDD_GPU_SOC 3.10/3.31 W, VIN_SYS_5V0 5.57/5.82 W. Rails are reported individually and are not summed

(a) Synchronized process resources

(b) Perception-stage latency

(c) Reachability planning latency and outcome

(d) Message rates and semantic output

Recorded samples only; no interpolation or missing-data imputation. topo_gng CPU/PSS combines RealSense capture, DD-GNG, and async YOLO in one process. A zero-valued first process-CPU baseline is excluded when present. Point samples are bounded inclusively by recording_started/stopped. Message rates use only complete periodic intervals wholly inside that window, plotted at interval midpoints; startup, shutdown_partial, and boundary-overlap intervals are excluded. Data notes: excluded 8 topic-health rows whose intervals only partially overlap the operator window; excluded non-periodic topic-health rows (shutdown_partial=8, startup=8).
